Preface

The following work was carried out at the Department of Experimental Psychology, University of Cambridge, during the years of 1997–2000, under the supervision of Professor Barry J. Everitt.

I hereby declare that this dissertation has not been submitted, in whole or in part, for any other degree, diploma or qualification at any other University. This dissertation is the result of my own work and includes nothing that is the outcome of work done in collaboration. I have attempted to reference appropriately any idea or finding that is not my own.

This dissertation does not exceed the limit of length specified by the Degree Committee for Biology, as stated in the Memorandum to Graduate Students.

Abstract

This thesis investigated the role played by regions of the prefrontal cortex and ventral striatum in the control of rats' behaviour by Pavlovian conditioned stimuli, and in their capacity to choose delayed reinforcement.

First, the function of the anterior cingulate cortex (ACC) in simple Pavlovian conditioning tasks was addressed. The ACC is a subdivision of prefrontal cortex that has previously been suggested to be critical for the formation of stimulus–reward associations. It was found that lesions of the ACC did not prevent rats from learning a simple conditioned approach response to a conditioned stimulus (CS) predictive of food reward, or from utilizing that CS as a conditioned reinforcer subsequently. Additionally, these subjects successfully acquired a conditioned freezing response to a CS predicting footshock. However, the same animals were impaired at the acquisition of autoshaped behaviour, an impairment that has been demonstrated previously. An autoshaping deficit was also observed when lesions were made following training. The phenomenon of Pavlovian–instrumental transfer was intact in these subjects. The hypothesis was developed that the ACC is not critical for the formation of stimulus–reward associations *per se*, but is critical when multiple stimuli must be discriminated on the basis of their differential association with reward. In support of this hypothesis, animals with lesions of the ACC were impaired on a version of the conditioned approach task in which a second, neutral stimulus, perceptually similar to the CS, was added; the lesioned subjects exhibited reduced discrimination.

Second, the role of the nucleus accumbens (Acb) in Pavlovian–instrumental transfer was investigated. The nucleus accumbens core, together with a larger amygdalar–striatal network of which it is a component, has previously been shown to be necessary for the expression of 'simple' Pavlovian–instrumental transfer. Rats with lesions of the nucleus accumbens core (AcbC) and shell (AcbSh) were tested on a 'response-specific' Pavlovian–instrumental transfer task, in which a Pavlovian CS selectively enhances instrumental responding for the outcome with which the CS was originally paired. AcbC lesions impaired the response specificity of this effect, while AcbSh lesions abolished Pavlovian–instrumental transfer entirely. These results are consistent with some — but not all — previous results in suggesting that the shell provides 'vigour' and the core provides 'direction' for the potentiation of behaviour by Pavlovian CSs.

Third, an attempt was made to train rats on a task for assessing preference for delayed reinforcement, using the 'adjusting-delay' paradigm. It was not immediately apparent that the rats reacted to the contingencies operative in this task, and mathematical analysis of their behaviour was conducted to establish whether their behaviour was sensitive to the delay, and what 'molar' features of performance on this task could be explained by delay-independent processes.

Fourth, a different delayed reinforcement choice task was developed, modifying a previously published task in which the subject is repeatedly offered a choice, in discrete trials, of a small reward delivered immediately, and a large reward delivered after a delay, with the delays systematically varied by the experimenter. Rats were trained on versions of this task in which the large, delayed reinforcer was or was not explicitly signalled by a cue present during the delay. The behavioural basis of performance on this task was examined, and *d*-amphetamine, chlordiazepoxide, and α -flupenthixol were administered systemically. It was found that the effects of *d*-amphetamine depended on whether the delayed reinforcer was signalled or unsignalled, increasing preference for signalled delayed reinforcement at some doses, but decreasing preference for unsignalled delayed reinforcement. These results may resolve contradictions in the literature, and are suggested to reflect the known effect of amphetamine to potentiate responding for conditioned reinforcers.

Fifth, rats that had been trained on this task (with no explicit signals present during the delay) were given lesions of the ACC, AcbC, or medial prefrontal cortex (mPFC). ACC-lesioned rats were no different from sham-operated controls in their ability to choose a large, delayed reinforcer. Lesions of mPFC reduced the tendency of subjects to shift from one lever to the other during the course of a session, but mPFC-lesioned subjects responded normally to removal of the delays, suggesting a loss of stimulus control. However, rats with lesions of the AcbC were severely impaired on this task, preferring the small, immediate reward, even though they discriminated the reinforcers. Additionally, the effects of intra-Acb amphetamine were assessed using a different version of the delayed reinforcement choice task, and found to have slight but inconsistent effects to reduce preference for the delayed reinforcer, though this effect did not depend on whether the delayed reward was signalled or unsignalled. These results suggest that the AcbC contributes significantly to the rat's ability to choose a delayed reward, a finding that has important implications for the understanding of Acb function. It is suggested that dysfunction of the AcbC may be a key element in the pathology of impulsivity.

Acknowledgements

First, I would like to thank Barry Everitt, who has been the best supervisor I could have wished for. His support, guidance, and encouragement made it all possible. I would also like to thank Trevor Robbins for his enthusiastic and insightful advice and support.

Thanks to John Parkinson for showing me the true path, for alcohol, for the coffee mornings of science. Thanks to Jeremy Hall for all those discussions, for showing me the many uses of electricity, for dinners and Withnail. Thanks to Tony Dickinson for explaining things patiently, and to Nick Mackintosh, not only for making available the facilities of his department, but for introducing me to the world of animal learning theory several years ago.

Thanks to Caroline Morrison for being a true friend and for knowing All about histology. Thanks to Anastasia Christakou for all the dinner excursions. Thanks to Cella Olmstead for getting me started and to Tim Bussey and Lisa Saksida for advice. Thanks to Nathaniel Daw for intellectual input, for running rats, and for beers underground. Thanks to all those others who helped run rats and were fun to work with: Guillaume Lachenal, Hosnieh Djafari Marbini, Andy Toner, David Pennicott, and Lakmali Sugathapala.

Thanks to Helen Sweet-Gossage for help with histology and instruction in the ways of the fen, to Rachel Underwood for histology, and to Simon Howes for teaching me stereotaxic surgery and many facts about cars.

Thanks to those others in the lab who made it such a fun place to be and enlivened trips from it, including Mercedes Arroyo, Maria Pilla, Pat di Ciano, Dan Hutcheson, and Kerrie Thomas.

Thanks to all those who looked after the animals so well, especially Mark Pauley and Julie Gautrey. Thanks to John Bashford, Hubert Jackson, Ian Cannell, John Picton, and John Baldwin, for help with photomicrography, matters electrical, slide presentation, metalwork, and computer networking respectively. I would also like to thank those researchers who took time to answer a stranger's questions so thoroughly, in particular Chris Bradshaw, James Mazur, John Evenden, and David Howell.

I am eternally grateful to those who taught me years ago and set me on this path; in particular, to Ian Gordon, Clare Mackay, Jane Lloyd, Duncan Lord, David Mansfield (sadly deceased), Geoff Cooke, Brian Dallaway, Bill Wright, and Tim Gill.

Thanks to Mark Rawlings, Carsten Zatschler, Ellen Rawlinson, and Rowan Cruft for more than I could ever repay. Thanks to Catrin Thomas for being there and putting up with so much. Thanks to Rob Milner, Paul Milligan, and Charles Offer for being fun to live with, to Sonia Zakrzewski for drinks and geckos, and to everyone else in and around Cambridge who partied. Thanks to the hundreds of composers, musicians, authors, and film directors who entertained me over the last three years. Finally, thanks to Ann and John Cardinal for everything.

Abbreviations used in this thesis

1. Pharmacology and chemistry

5-HIAA	5-hydroxyindoleacetic acid
5-HT	5-hydroxytryptamine (serotonin)
6-OHDA	6-hydroxydopamine
CCK	cholecystokinin
DA	dopamine
GABA	γ -aminobutyric acid
LiCl	lithium chloride
NMDA	<i>N</i> -methyl-D-aspartate
PB	phosphate buffer
PBS	phosphate-buffered saline

2. Psychology

CPP	conditioned place preference
CR	conditioned response
CRf	conditioned reinforcer
CS	conditioned stimulus
CS-	negative conditioned stimulus (i.e. predicts absence of stimulus)
CS+	positive, or predictive conditioned stimulus (be it appetitive or aversive)
CS ₀	neutral conditioned stimulus (strictly uncorrelated with stimulus)
CVD	conditional visual discrimination
ext	extinction
FI	fixed interval
FR	fixed ratio
IRI	interreinforcement interval
IRT	interresponse time
ISI	interstimulus interval
ITI	intertrial interval
NCRf	not-conditioned-reinforcer (e.g. a lever that produces no response; a control)
NS	not significant
OR	orienting response
PIT	Pavlovian to instrumental transfer
RI	random interval
RT	random time
S	subject (in analysis of variance notation); stimulus
UR	unconditioned response
US	unconditioned stimulus
VI	variable interval
VR	variable ratio

3. *Neurobiology and medicine*

ADHD	attention deficit/hyperactivity disorder
APCR	amphetamine potentiation of conditioned reinforcement
fMRI	functional magnetic resonance imaging
i.c.v.	intracerebroventricular
i.p.	intraperitoneal
i.v.	intravenous
IVSA	intravenous self-administration
MRI	magnetic resonance imaging (= nuclear magnetic resonance, NMR)
NMR	nictitating membrane reflex (eye-blink), typically in the rabbit
OCD	obsessive–compulsive disorder
PET	positron emission tomography
EEG	electroencephalogram
ERN	error-related negativity

4. *Neuroanatomy*

Abbreviations are those used by Paxinos & Watson (1996), except for those marked (*).

Acb	nucleus accumbens
AcbC	nucleus accumbens, core
AcbSh	nucleus accumbens, shell
ACC	anterior cingulate cortex (*)
AV	anteroventral nucleus of the thalamus
BLA	basolateral amygdala (BL) (*)
CeA	central amygdaloid nucleus (Ce) (*)
Cg1	cingulate cortex, area 1
Cg2	cingulate cortex, area 2
CPu	caudate putamen (striatum)
DLPFC	dorsolateral prefrontal cortex (*)
DS	dorsal striatum (*)
LC	locus coeruleus
LH	lateral hypothalamic area
MD	mediodorsal nucleus of the thalamus
NBM	nucleus basalis magnocellularis (nucleus of Meynert) (*)
OFC	orbitofrontal cortex (*)
OMPFC	orbitomedial prefrontal cortex (*)
PAG	periaqueductal grey
PCC	posterior cingulate cortex (*)
PFC	prefrontal cortex (*)
PRh	perirhinal cortex
SN	substantia nigra
SNc	substantia nigra pars compacta
SNr	substantia nigra pars reticulata
Sub	subiculum (S) (*)
VP	ventral pallidum
VS	ventral striatum (comprising Acb, ventromedial portions of caudate/putamen, olfactory tubercle) (*)

VSub	ventral subiculum (*)
VTA	ventral tegmental area

5. Physical units

These may be prefixed with k (kilo-, 10^3); c (centi-, 10^{-2}); m (milli-, 10^{-3}); μ (micro-, 10^{-6}).

A	amp ($C s^{-1}$)
C	coulomb
cd	candela
g	gram
h	hour (3600 s)
Hz	Hertz (s^{-1})
l	litre ($10^{-3} m^3$)
m	metre
M	molar ($mol l^{-1}$)
min	minute (60 s)
mol	mole ($\approx 6.022 \times 10^{23}$)
N	Newton ($kg m s^{-2}$)
s	second
W	watt ($kg m^2 s^{-3}$)

6. Statistics and probability

*	significant at $\alpha = 0.05$
**	significant at $\alpha = 0.01$
***	significant at $\alpha = 0.001$
ANOVA	analysis of variance
F	F statistic: the ratio of $MS_{\text{treatment}}$ to MS_{error}
MS	mean square
$P(X / Y)$	the probability of X, given that Y is true
P, p	probability
SD	standard deviation
SE	standard error
SED	standard error of the difference (between means)
SEM	standard error of the mean
α	threshold for determining statistical significance
$\tilde{\epsilon}$	Huynh–Feldt epsilon
μ	mean

7. General

\varnothing	diameter
$\sqrt{\quad}$	square root
W, D, H	(when referring to dimensions) width, depth, height
p. / pp.	page / pages
